

# Neosemimagic Tilings

A generalisation which includes both semimagic squares and perfect squared squares brings new challenges!

Geoff Morley  
MathsJam 2019

You've heard of these:

## SEMIMAGIC SQUARE

9	5	1
4	3	8
2	7	6

Distinct numbers.

Every row sum and column sum is the same (the magic sum or magic constant).

In a "normal" semimagic square the numbers are consecutive integers starting with 1.

## PERFECT SQUARED SQUARE (PSS)

No two squares are the same size. The Order N is the number of squares.

## POLYOMINO

A polygon, which may have polygonal holes, formed by equal-sized squares joined edge-to-edge.

But here's something completely new:

## NEOSEMIMAGIC TILING

A tiling of a polyomino by polyominoes, where

- Each tile is either empty or contains a distinct positive integer.
- The order  $N$  of the tiling is the number of non-empty tiles.
- **The sum  $S$  of the numbers in the tiles intersected by any horizontal or vertical line is the same (the magic sum or magic constant).**

There may be fewer constraints: for example negative numbers may be allowed, but the numbers must still be distinct.

Or there may be additional constraints: for example every number must be of the same type, such as a square, cube, semiprime, or triangular number.

Every semimagic square and PSS is a Neosemimagic Square (NSMS).

# EXAMPLES OF NEOSEMIMAGIC RECTANGLES (NSMRs)

N=13, S=28

16			2
	9	1	
5			13
	11		
4			6
	10	8	
3			7

N=10, S=55250

$176^2$	$153^2$	$24^2$	$17^2$
$145^2$		$185^2$	
$57^2$	$104^2$	$143^2$	$144^2$

Every number is a distinct square.

# CHALLENGE 1

Do any of these tilings (with  $N=13$ ) admit NSMSs of squares?

\*: Empty tile.

# An NSMS of 13 semiprimes

<b>58</b>	<b>55</b>	<b>291</b>	<b>21</b>
<b>301</b>		<b>69</b>	
<b>51</b>		<b>305</b>	<b>309</b>
		<b>65</b>	
<b>15</b>	<b>319</b>	<b>26</b>	

$$S = 425$$

# An NSMS with 11 consecutive semiprimes, and two other numbers, one of which is negative

<b>5366</b>	<b>5359</b>		<b>5345</b>	<b>13</b>
<b>5357</b>			<b>5367</b>	
<b>5363</b>		<b>5353</b>		
		<b>5371</b>		<b>5354</b>
<b>-3</b>	<b>5361</b>			

Contains every semiprime  
from 5345 to 5371  
but also a negative  
number!

# NOT QUITE A NEOSEMIMAGIC CYLINDER!

Every horizontal sum is  
1501, but the vertical  
sums have three  
different values!

1501 1501 1421 1421 1421 1421 1501 1661 <== Vertical sums

# NEOSEMIMAGIC TORUS

No problem here. Every horizontal and vertical sum is the same (S=1378).

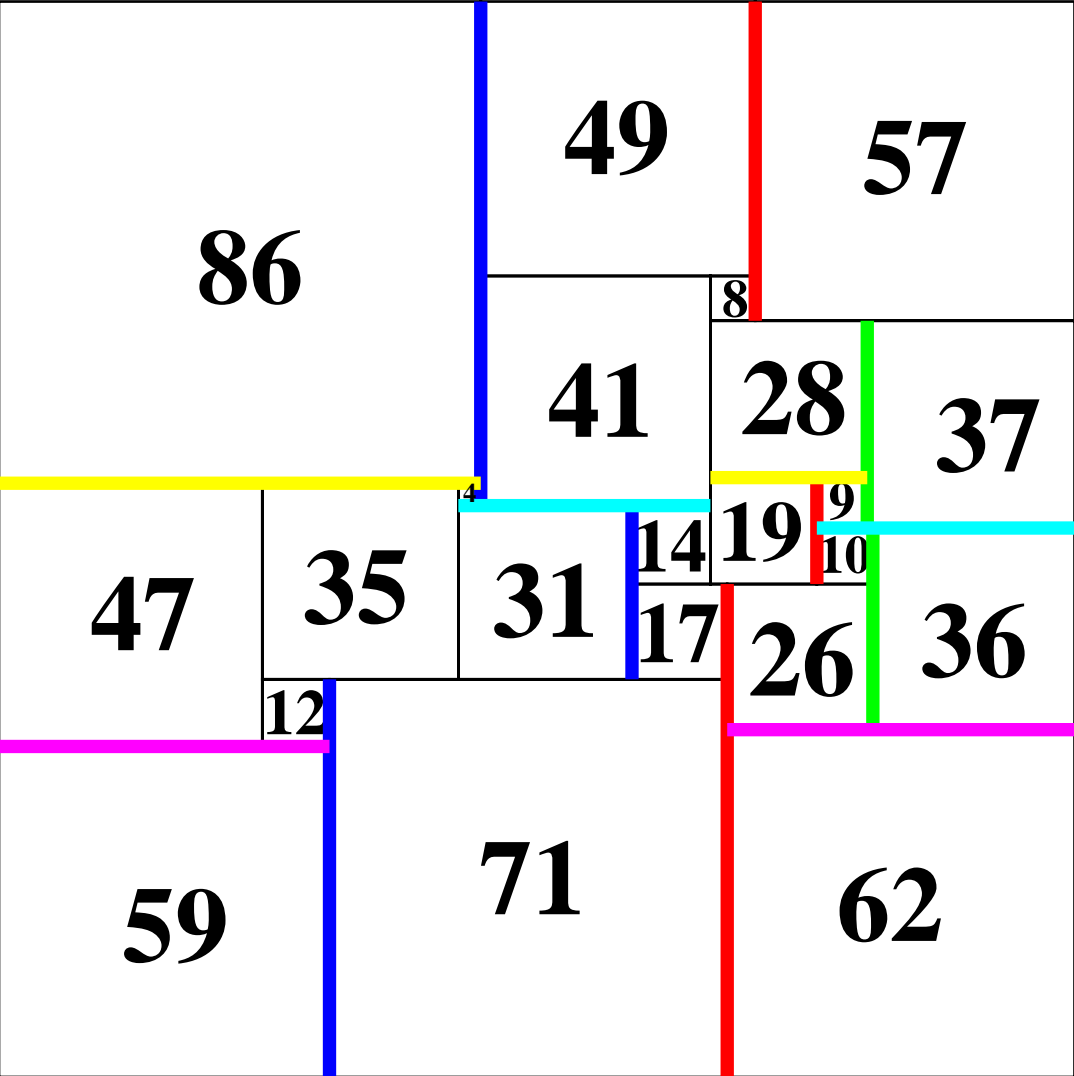

## CHALLENGE 2

For each order, what is the smallest magic sum for an NSMR (other than that of a semimagic square if the order is a square)?

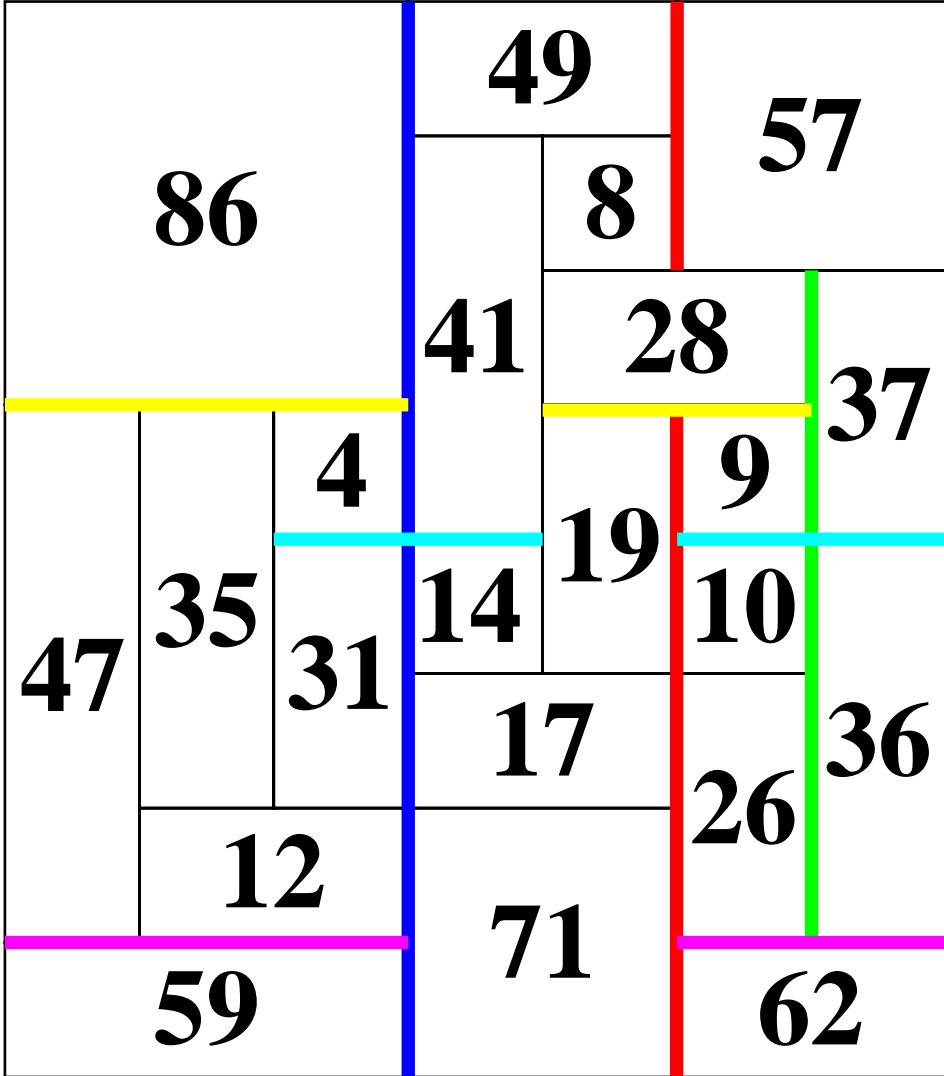

## CHALLENGE 3

What if we limit ourselves to NSMRs whose numbers can be replaced by those in a PSS? (See next two slides.)

# A PSS/NSMS and an alternate (topologically equivalent) NSMR after certain sets of line segments have been made collinear

22:192 (AJWD,1978)  
The order 22 PSS with the largest side.

An alternate 22:192 NSMR  
with the same numbers.

# NSMRs with the same tiling with numbers

(A) As in a PSS.

(B) With the smallest magic sum.

86			49		57	
			41	8		
28						
4	19	9				
		35	14	10	36	
47	31	17		26		
		12	71			
59		62				

Alternate 22:192 NSMR

33			21		15	
			14	7		
6						
2	12	8		18		
		10	3		4	9
13	10	5		11		
		1	26			
23		20				

22:69 (GHM,2018)

Includes the 16 consecutive integers starting with 1.
